Safety Instructions

This battery contains lithium, organic solvents, and other combustible materials. For this reason, improper handling of the battery could lead to distortion, leakage*, overheating, explosion, or fire, causing bodily injury or equipment trouble. Please observe the following instructions to prevent accidents.

(* Leakage is defined as the unintentional escape of a liquid from a battery.)

**Warnings — Handling**

- **Keep battery out of reach of children.** Swallowing can lead to chemical burns, perforation of soft tissue, and death. Severe burns can occur within 2 hours of ingestion. If swallowed, seek medical attention immediately.

- **Never charge.** The battery is not designed to be charged by any other electrical source. Charging could generate gas and internal short-circuiting, leading to distortion, leakage, overheating, explosion, or fire.

- **Never heat.** Heating the battery to more than 100 deg. C* could increase the internal pressure, causing distortion, leakage, overheating, explosion, or fire. (* Consult Maxell regarding heat resistant coin type lithium manganese dioxide batteries.)

- **Never expose to open flames.** Exposing to flames could cause the lithium metal to melt, causing the battery to catch on fire and explode.

- **Never disassemble the battery.** Do not disassemble the battery, because the separator or gasket could be damaged, leading to distortion, leakage, overheating, explosion, or fire.

- **Never reverse the positive and negative terminals when mounting.** Improper mounting of the battery could lead to short-circuiting, charging or forced-discharging. This could cause distortion, leakage, overheating, explosion, or fire.

- **Never short-circuit the battery.** Do not allow the positive and negative terminals to short-circuit. Never carry or store the battery with metal objects such as a necklace or a hairpin. Do not take multiple batteries out of the package and pile or mix them when storing. Otherwise, this could lead to distortion, leakage, overheating, explosion, or fire.

- **Never weld the terminals or weld a wire to the body of the battery directly.** The heat of welding or soldering could cause the lithium to melt, or cause damage to the insulating material in the battery. This could cause distortion, leakage, overheating, explosion, or fire. When soldering the battery directly to equipment, solder only the tabs or leads. Even then, the temperature of the soldering iron must be below 350 deg. C and the soldering time less than 5 seconds. Do not use a soldering bath, because the circuit board with battery attached could stop moving or the battery could drop into the bath. Moreover do not use excessive solder, because the solder could flow to unwanted portions of the board, leading to a short-circuit or charging of the battery.

- **Never use different batteries together.** Using different batteries together, i.e. different type or used and new or different manufacturer could cause distortion, leakage, overheating, explosion, or fire because of the differences in battery property. If using two or more batteries connected in series or in parallel even same batteries, please consult with Maxell before using.

- **Never allow liquid leaking from the battery to get in your eyes or mouth.** Because this liquid could cause serious damage, if it does come in contact with your eyes, flush them immediately with plenty of water and consult a physician. Likewise, if the liquid gets in your mouth, rinse immediately with plenty of water and consult a physician.

- **Keep leaking batteries away from fire.** If leakage is suspected or you detect a strong odor, keep the battery away from fire, because the leaked liquid could catch on fire.

- **Never touch the battery electrodes.** Do not allow the battery electrodes to come in contact with your skin or fingers. Otherwise, the moisture from your skin could cause a discharge of the battery, which could produce certain chemical substances causing you to receive a chemical burns.
This is a primary battery and cannot be charged. If used in memory or RTC back-up applications, be sure to use diodes to prevent charging from the main power source or other batteries, and a protective resistor to regulate the current as shown in the figure below. Note that the points described below should be taken into careful consideration when selecting diodes and protective resistors.

**Supplied voltage to load**
Because a diode and a resistor generate the voltage drop on operating, please take into consideration these voltage drops for supplied voltage to load.

**Using diodes to prevent charging**
Please choose diodes with leak current as small as possible. Please keep the charged capacity due to leak current to within 1% of nominal capacity.

**Using and setting protective resistors**
A protective resistor is used to prevent the battery from being charged by large surges of current during diode failure. Please set the resistor so that the maximum current shown in the right table is not exceeded. For example, say a CR2032 battery is used in sample circuit (A) in combination with a main power source 5 volt. Since the permitted charge current is 10mA and this battery’s voltage is 3V, let the resistor be $R_2=(5V-3V)/10mA=0.2$ ohm, meaning that at least 0.2k ohm is required.

Note: If the diodes broke down, it is necessary for safety to replace them as soon as possible even though using a protective resistor. Considering the trouble of diodes and resistors, other safety measures should be incorporated in the circuit design.

---

**Warnings — Circuit Design for Back-up Use**

**Warnings — Disposal**

The battery may be regulated by national or local regulation. Please follow the instructions of proper regulation. As electric capacity is left in a discarded battery and it comes into contact with other metals, it could lead to distortion, leakage, overheating, or explosion, so make sure to cover the (+) and (-) terminals with friction tape or some other insulator before disposal.

---

**Warning — Handling/Storage**

- **Never expose the battery to ultrasonic sound.**
  Exposing the battery to ultrasonic sound may cause short-circuiting because the inside material is broken into pieces, leading to distortion, leakage, overheating, explosion, or fire.

- **Never subject the battery to severe shock.**
  Dropping, throwing or stomping on the battery may cause distortion, leakage, overheating, explosion, or fire.

- **Never short-circuit the battery while installing into equipment.**
  Please be careful when installing the battery not to short-circuit it with metal portions of the equipment.

- **Use the correct battery suitable for the equipment.**
  The battery may not be suitable for the specific equipment due to the using conditions or type of equipment. Please select the suitable battery according to the handling instructions of the equipment.

- **Never use or leave the battery in a hot place such as under the direct rays of the sun or in a car in hot weather.**
  If you do, this may cause distortion, leakage, overheating, explosion, or fire.

- **Never allow the battery to come in contact with water.**
  If it does, this may cause the battery to rust or lead to distortion, leakage, overheating, explosion, or fire.

- **Never store the battery in a hot and humid environment.**
  Otherwise it may cause battery performance deterioration, deformation, leakage, overheating, or explosion.

- **Keep contact force more than 2N.**
  The battery voltage may be lower than intended value because of poor contact condition, please keep contact force more than 2N for suitable contact resistance.
Overview

Maxell’s cylindrical type lithium manganese dioxide battery realizes stable discharge characteristics with its original sealing structure, improved electrical-conductivity structure, and negative electrode material. This battery’s high reliability makes it ideal for use as a power source in industrial applications such as security devices and electronic meters. Assembled batteries can also be produced to meet special customer requirements. For details, please contact your nearest Maxell dealer or distributor.

Features

- **Long-term reliability of 10 years**
The employment of a heat-resistant gasket and a laser-seal structure prevents water intrusion and electrolyte evaporation, ensuring a long-term reliability of 10 years. The self-discharge rate is about 0.5% per year.
- **Stable discharge characteristics**
The original negative electrode material maintains low internal resistance even at high depths of discharge and ensures stable discharge.
- **Superior low-temperature characteristics**
- **High safety due to internal short-circuit prevention structure**
  * Designed lifetime at 20 deg. C when not yet used. Actual lifetime will vary depending on conditions such as discharge current and temperature.

Construction

The cylindrical type lithium manganese dioxide battery uses manganese dioxide (MnO₂) as its positive active material, and lithium (Li) as its negative active material.

**Battery reactions**
- Positive reaction: \( \text{MnO}_2 + \text{Li}^+ + e^- \rightarrow \text{MnO}_2\text{Li} \)
- Negative reaction: \( \text{Li} \rightarrow \text{Li}^+ + e^- \)
- Total reaction: \( \text{MnO}_2 + \text{Li} \rightarrow \text{MnO}_2\text{Li} \)

Principle and Reactions

The cylindrical type lithium manganese dioxide battery uses manganese dioxide (MnO₂) as its positive active material, and lithium (Li) as its negative active material.

UL Recognized Components

The cylindrical type lithium manganese dioxide battery is a UL (Underwriters Laboratories Inc.) recognized component.

Technician Replaceable
- Recognized model: CR17450 AH
- Recognized models: CR17450 A, CR17335 A
- Certification Number: MH12568

Applications

- Security Devices
- Communication Tags
- ETC (Electronic Toll Collection System)
- Home Fire/Smoke Alarms
- Electronic Meters (Gas, Water, Electricity)
- Memory Backup Power
